Choroidal thicknesses of eyes with pachychoroid phenotype greater than 300  $\mu$ m together with and without retinal pigment epithelium abnormalities were evaluated as uncomplicated pachychoroid (UCP) and pachychoroid pigment epitheliopathy (PPE), respectively. Statistical analyses were performed using the SPSS software, version 21.

x Fundus autofluorescence (FAF) and widefield angiography (WFA) are relatively new imaging modalities becoming ubiquitous in many clinical practices. FAF uses the properties and distribution of retinal pigment to improve understanding of the pathophysiology of retinal diseases. Clinical applications of FAF continue to expand.

Primary angle-closure glaucoma (PACG) is a common cause of blindness. Angle closure is a fundamental pathologic process in PACG. With the development of imaging devices for the anterior segment of the eye, a better understanding of the pathogenesis of angle closure has been reached.

Optic disc drusen (ODD) or optic nerve head drusen (ONHD) are globules of mucoproteins and mucopolysaccharides that progressively calcify in the optic disc. They are thought to be the remnants of the axonal transport system of degenerated retinal ganglion cells. ODD have also been referred to as congenitally elevated or anomalous discs, pseudopapilledema, pseudoneuritis, buried disc drusen ...

ABSTRACT. Purpose: To describe the role of the optical coherence tomography, fluorescein and indocyanine green angiography findings in the diagnosis of idiopathic polypoidal choroidal vasculopathy (IPCV). Methods: A series of four eyes of three patients thought to have IPCV were examined and evaluated by optical coherence tomography, fluorescein and indocyanine green angiographies.
