From a signal processing point of view, the Gibbs phenomenon is the step response of a low-pass filter, and the oscillations are called ringing or ringing artifacts. Truncating the Fourier transform of a signal on the real line, or the Fourier series of a periodic signal (equivalently, a signal on the circle) corresponds to filtering out the higher frequencies by an ideal low-pass/high-cut filter.

Section 2 provides definitions of terms and concepts. Sections 3 and 4 review engineering and other multiscale applications. Section 5 provides a systematic synopsis of the methods. Section 6 includes syntheses and concluding remarks. Table 1 defines less common abbreviations that appear here in multiple, non-sequential paragraphs.
