

SIX DEGREES OF FREEDOM

**six degrees of freedom pdf**

Six degrees of freedom (6DoF) refers to the freedom of movement of a rigid body in three-dimensional space. Specifically, the body is free to change position as forward/backward (surge), up/down (heave), left/right (sway) translation in three perpendicular axes, combined with changes in orientation through rotation about three perpendicular axes, often termed yaw (normal axis), pitch ...

Motions and dimensions. The position of an n-dimensional rigid body is defined by the rigid transformation,  $[T] = [A, d]$ , where d is an n-dimensional translation and A is an  $n \times n$  rotation matrix, which has n translational degrees of freedom and  $n(n-1)/2$  rotational degrees of freedom. The number of rotational degrees of freedom comes from the dimension of the rotation group  $SO(n)$ .
