normal force The normal force acts to prevent an object from moving through a surface. The normal force is a reactive force, so there is no special formula for the magnitude of the normal force. The magnitude of the normal force is whatever it takes to prevent the object from moving through the surface, as determined from Newton's Second Law.

### **physics VELOCITY, ACCELERATION, FORCE velocity**

3) Find the net force (vector sum of all individual forces) 4) Find the acceleration of the object (second Newton's law) 5) With the known acceleration find kinematics of the object

I assume you are using Windows, here is a command line that will send the PC to sleep. `rundll32 powrprof.dll,SetSuspendState` you could either create a batch file to remotely execute this command on all pc at a certain time using `psexec`, and then another batch file to send a `wol` command out when you want them woken up.

The Beaufort scale / ? b o ? f ? r t / is an empirical measure that relates wind speed to observed conditions at sea or on land. Its full name is the Beaufort wind force scale

## **Beaufort scale - Wikipedia**

To calculate wind load using the generic formula, use  $F = A \times P \times C_d$ , where  $F$  is the force or wind load,  $A$  is the projected area of the object,  $P$  is the wind pressure, and  $C_d$  is the drag coefficient. First find  $A$ , the area of the 2-dimensional face the wind is hitting, using  $A = \text{length} \times \text{height}$  for a flat wall.
